

SHAPE ANALYSIS DRIVEN SURFACE CORRECTION

ON Animation Studios
Claude Levastre

Our production rig

- Fully procedural rig
 - Facial
 - Body
- Auto rig system
 - No blendshapes
 - No corrective blendshapes

Dynasculpt : *All in one* tool

- Pose space deformation
 - Facial
 - Body
- Artistic refinement
 - Post animation model polishing
 - Post corrections for physically simulated models

Dynasculpt main features

- Sculpt wrapping
 - Surface Local coordinate system
- Shape analysis to drive corrections
 - Direct drive
 - Across Radial Basis Function interpolators

Move Tool [Reset Tool] [Tool Help]

Move Settings

Move Axis: Object Local
 World Normal
 Along rotation axis Normals average
 Along live object axis
 Custom axis orientation
0.0000 0.0000 0.0000
[Set to Point] [Set to Edge] [Set to Face]

Preserve Child Transform
Preserve UVs

Discrete move:
Relative:
Step size: 0.01
 Tweak mode

Joint Orient Settings

Automatically Orient Joints

Orient Joint to World:
Primary Axis: X Y Z
Secondary Axis: X Y Z
Secondary Axis World Orientation: X Y Z

Move Snap Settings

Retain component spacing
Snap to live polygon: Face center Vertex

Common Selection Options

Selection Style: Marquee Camera based selection
 Drag Camera based paint selection

Soft Selection

Soft Select: [Reset]
Falloff mode: Volume

Sculpt wrapping

- Use smoothed normals of laplacian filtered mesh

Computing sculpt deltas

- Artist sculpts the corrected shape from a reference shape
- Compute smoothed normals of reference shape

For each moved vertex :

 Compute the delta in world space

 For each edge of vertex umbrella :

 Compute an edge matrix

 Compute a local delta using edge matrix

Local Delta for edge 1

Local Delta for edge 2

Local Delta for edge 3

Local Delta for edge 4

Restoring Sculpt deltas

- **Compute smoothed normals of current model**

For each vertex :

For each edge in vertex umbrella :

Compute edge matrix

Transform each local delta to get world delta

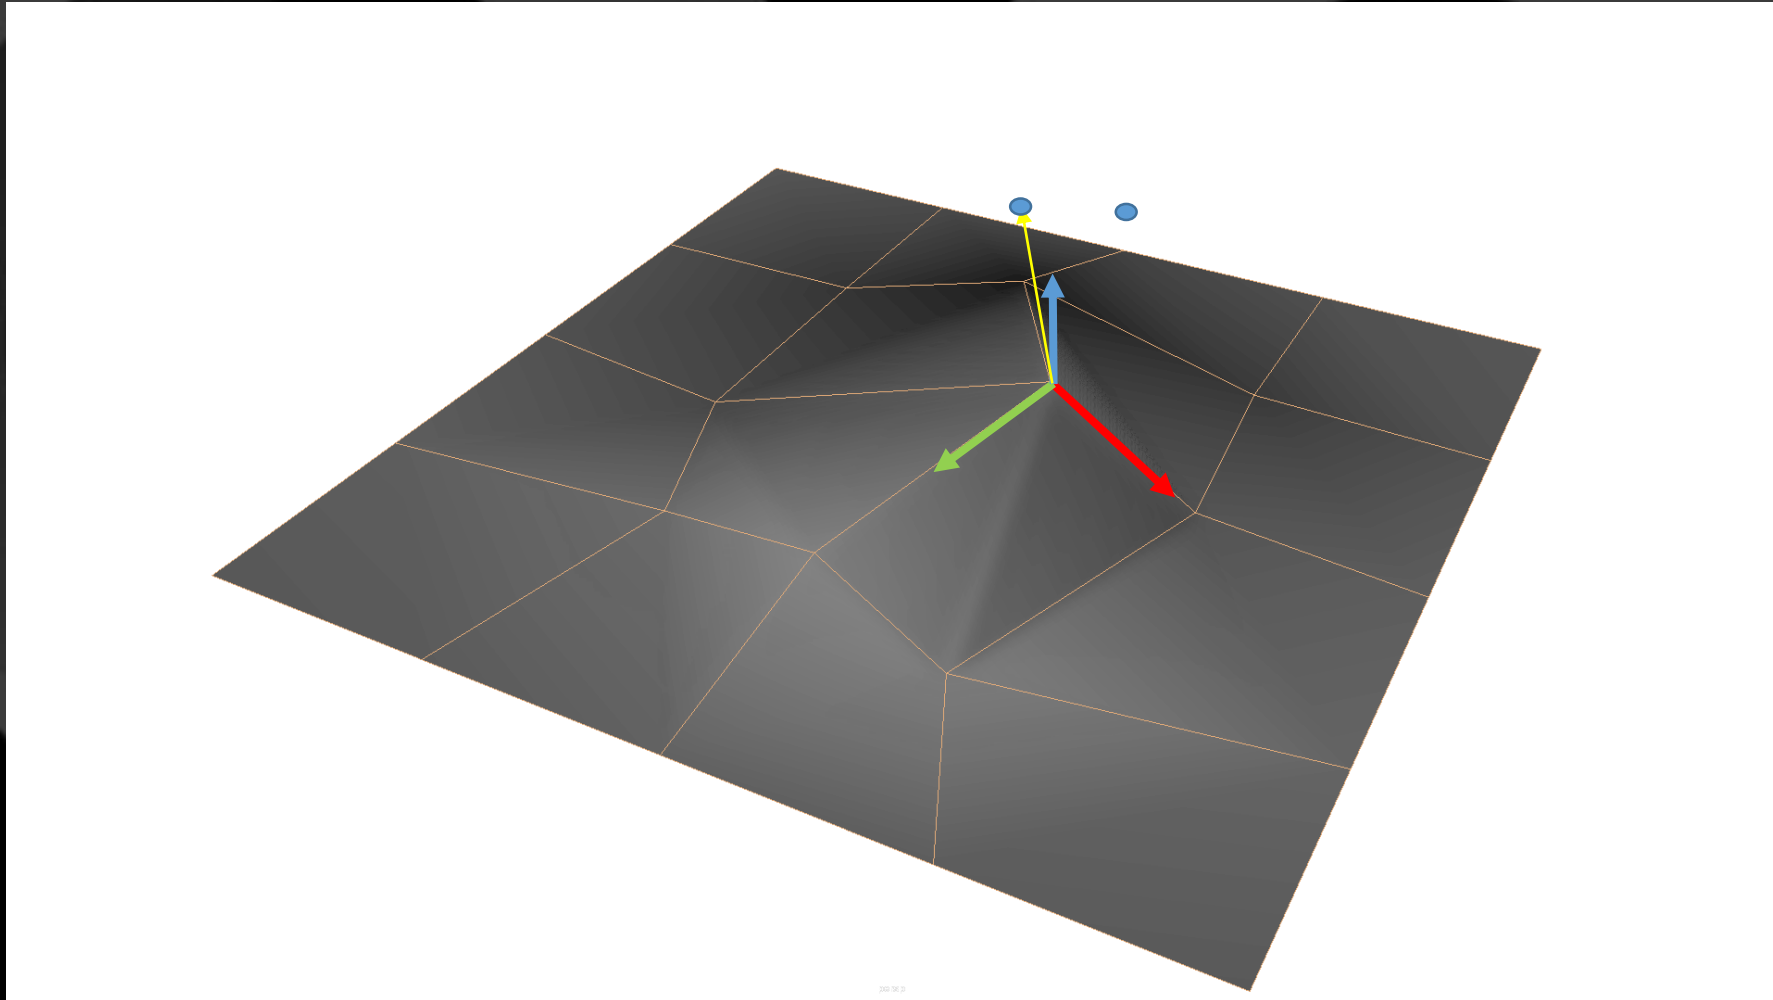

Compute average delta

Scale average delta to the right length

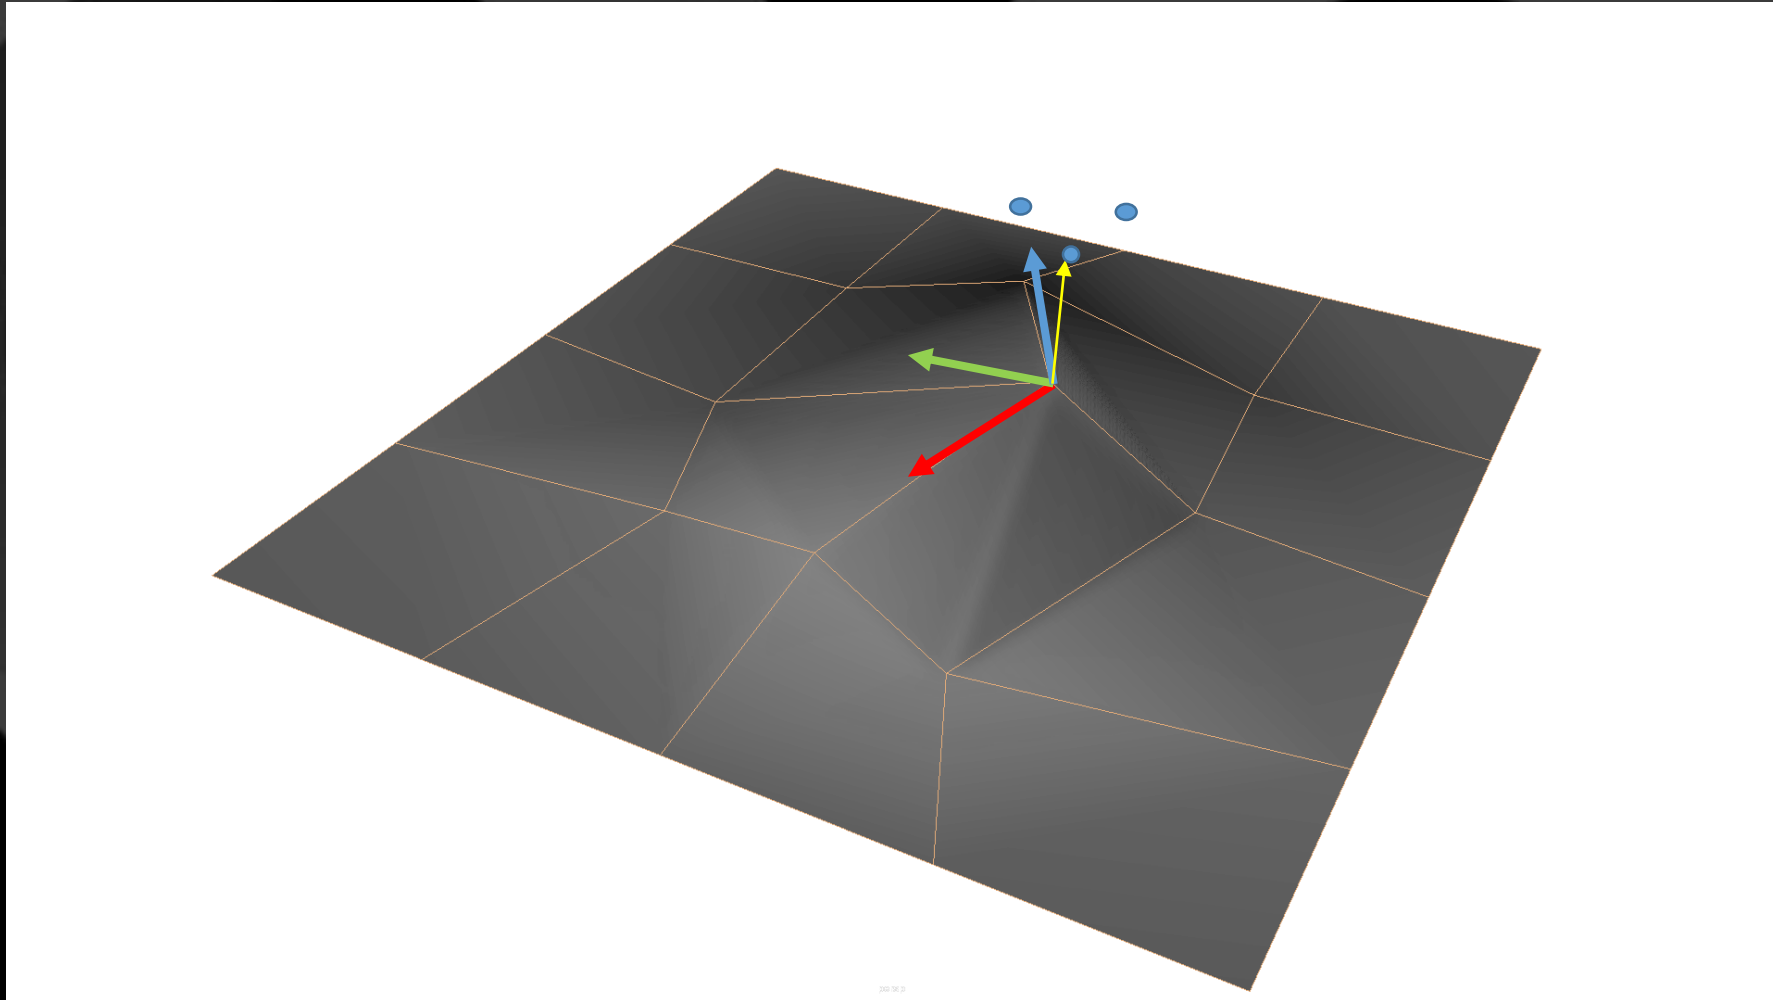

Restore local delta 1 in world space

Restore local delta 2 in world space

Restore local delta 3 in world space

Restore local delta 4 in world space

World delta is average of previous deltas

Multiple deltas VS classical simple delta

- More stability when restoring a sculpt
- Single delta technique failed with :
 - Huge tangential displacements (skin sliding)
 - Hard polygon deformation of target model

Sculpt wrapping efficiency

- Geometry post process
- Can be applied on current shape independently of previous deformations
- Sculptures are additive, orderless
- Good visual results when applied on animated model
- Good stability even with extreme deformation and polygon stretching

Shape Analysis

- Kind of point cloud comparison
- Similarity factor between
 - Reference shape of correction
 - Current shape of animated model

Shape analysis

Data needed :

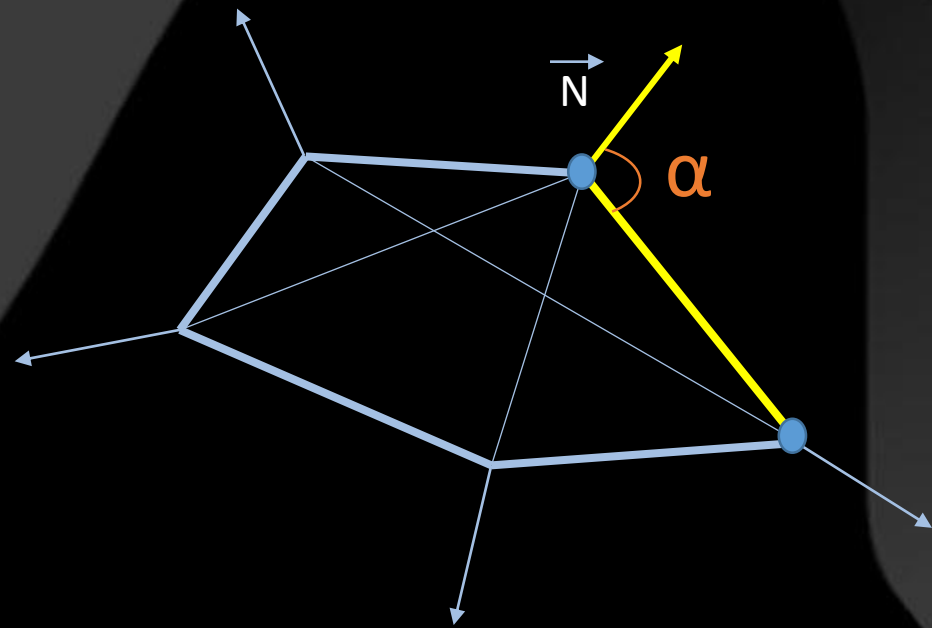

- A reference shape (the *wrong* shape to recognize)
- Current animated shape
- A set of vertices to analyse
 - Vertices moved by correction
 - User defined recognition zone

Angular variation of each possible vertex pair

- Reference shape

- Current shape

Angular variation of each possible vertex pair

- Reference shape

- Current shape

Angular variation of each possible vertex pair

- Reference shape

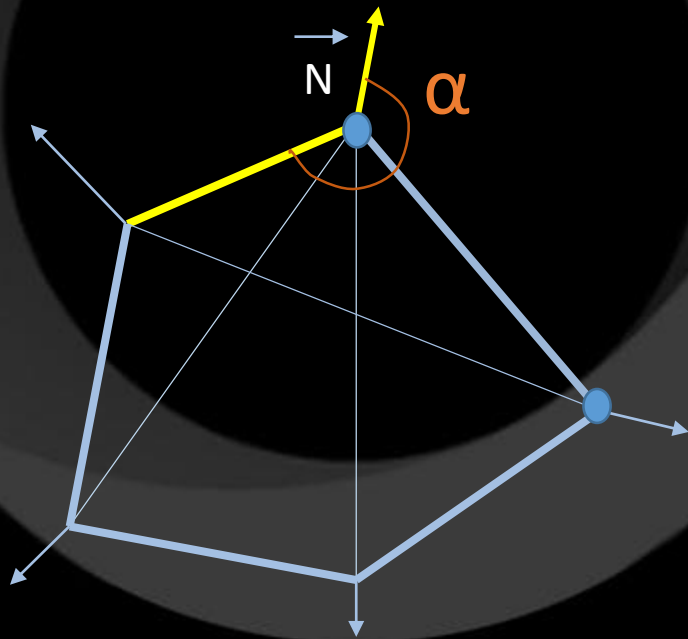

- Current shape

Angular variation of each possible vertex pair

- Reference shape

- Current shape

$$D_{ij} = 0.5 * \left| \left(\widehat{Vc_i - Vc_j} \right) \cdot \vec{Nc_i} - \left(\widehat{Vr_i - Vr_j} \right) \cdot \vec{Nr_i} \right|$$

$$\textit{Similarity} = 1.0 - s * \left(\frac{\sum_{i=0}^{n-1} \sum_{j=i+1}^n D_{ij}^p}{\frac{n*(n-1)}{2}} \right)^{\frac{1}{p}}$$

N = vertices count

Vc = current vertex position

Vr = reference vertex position

s = scale factor (user tuning)

Nc = current vertex normal

Nr = reference vertex normal

P = power mean factor (for user tuning)

persp

124.8 fps

Combine Shape Analysis with PSD ?

We need a
POSE SPACE
for
'Pose Space Deformation'

Current shape

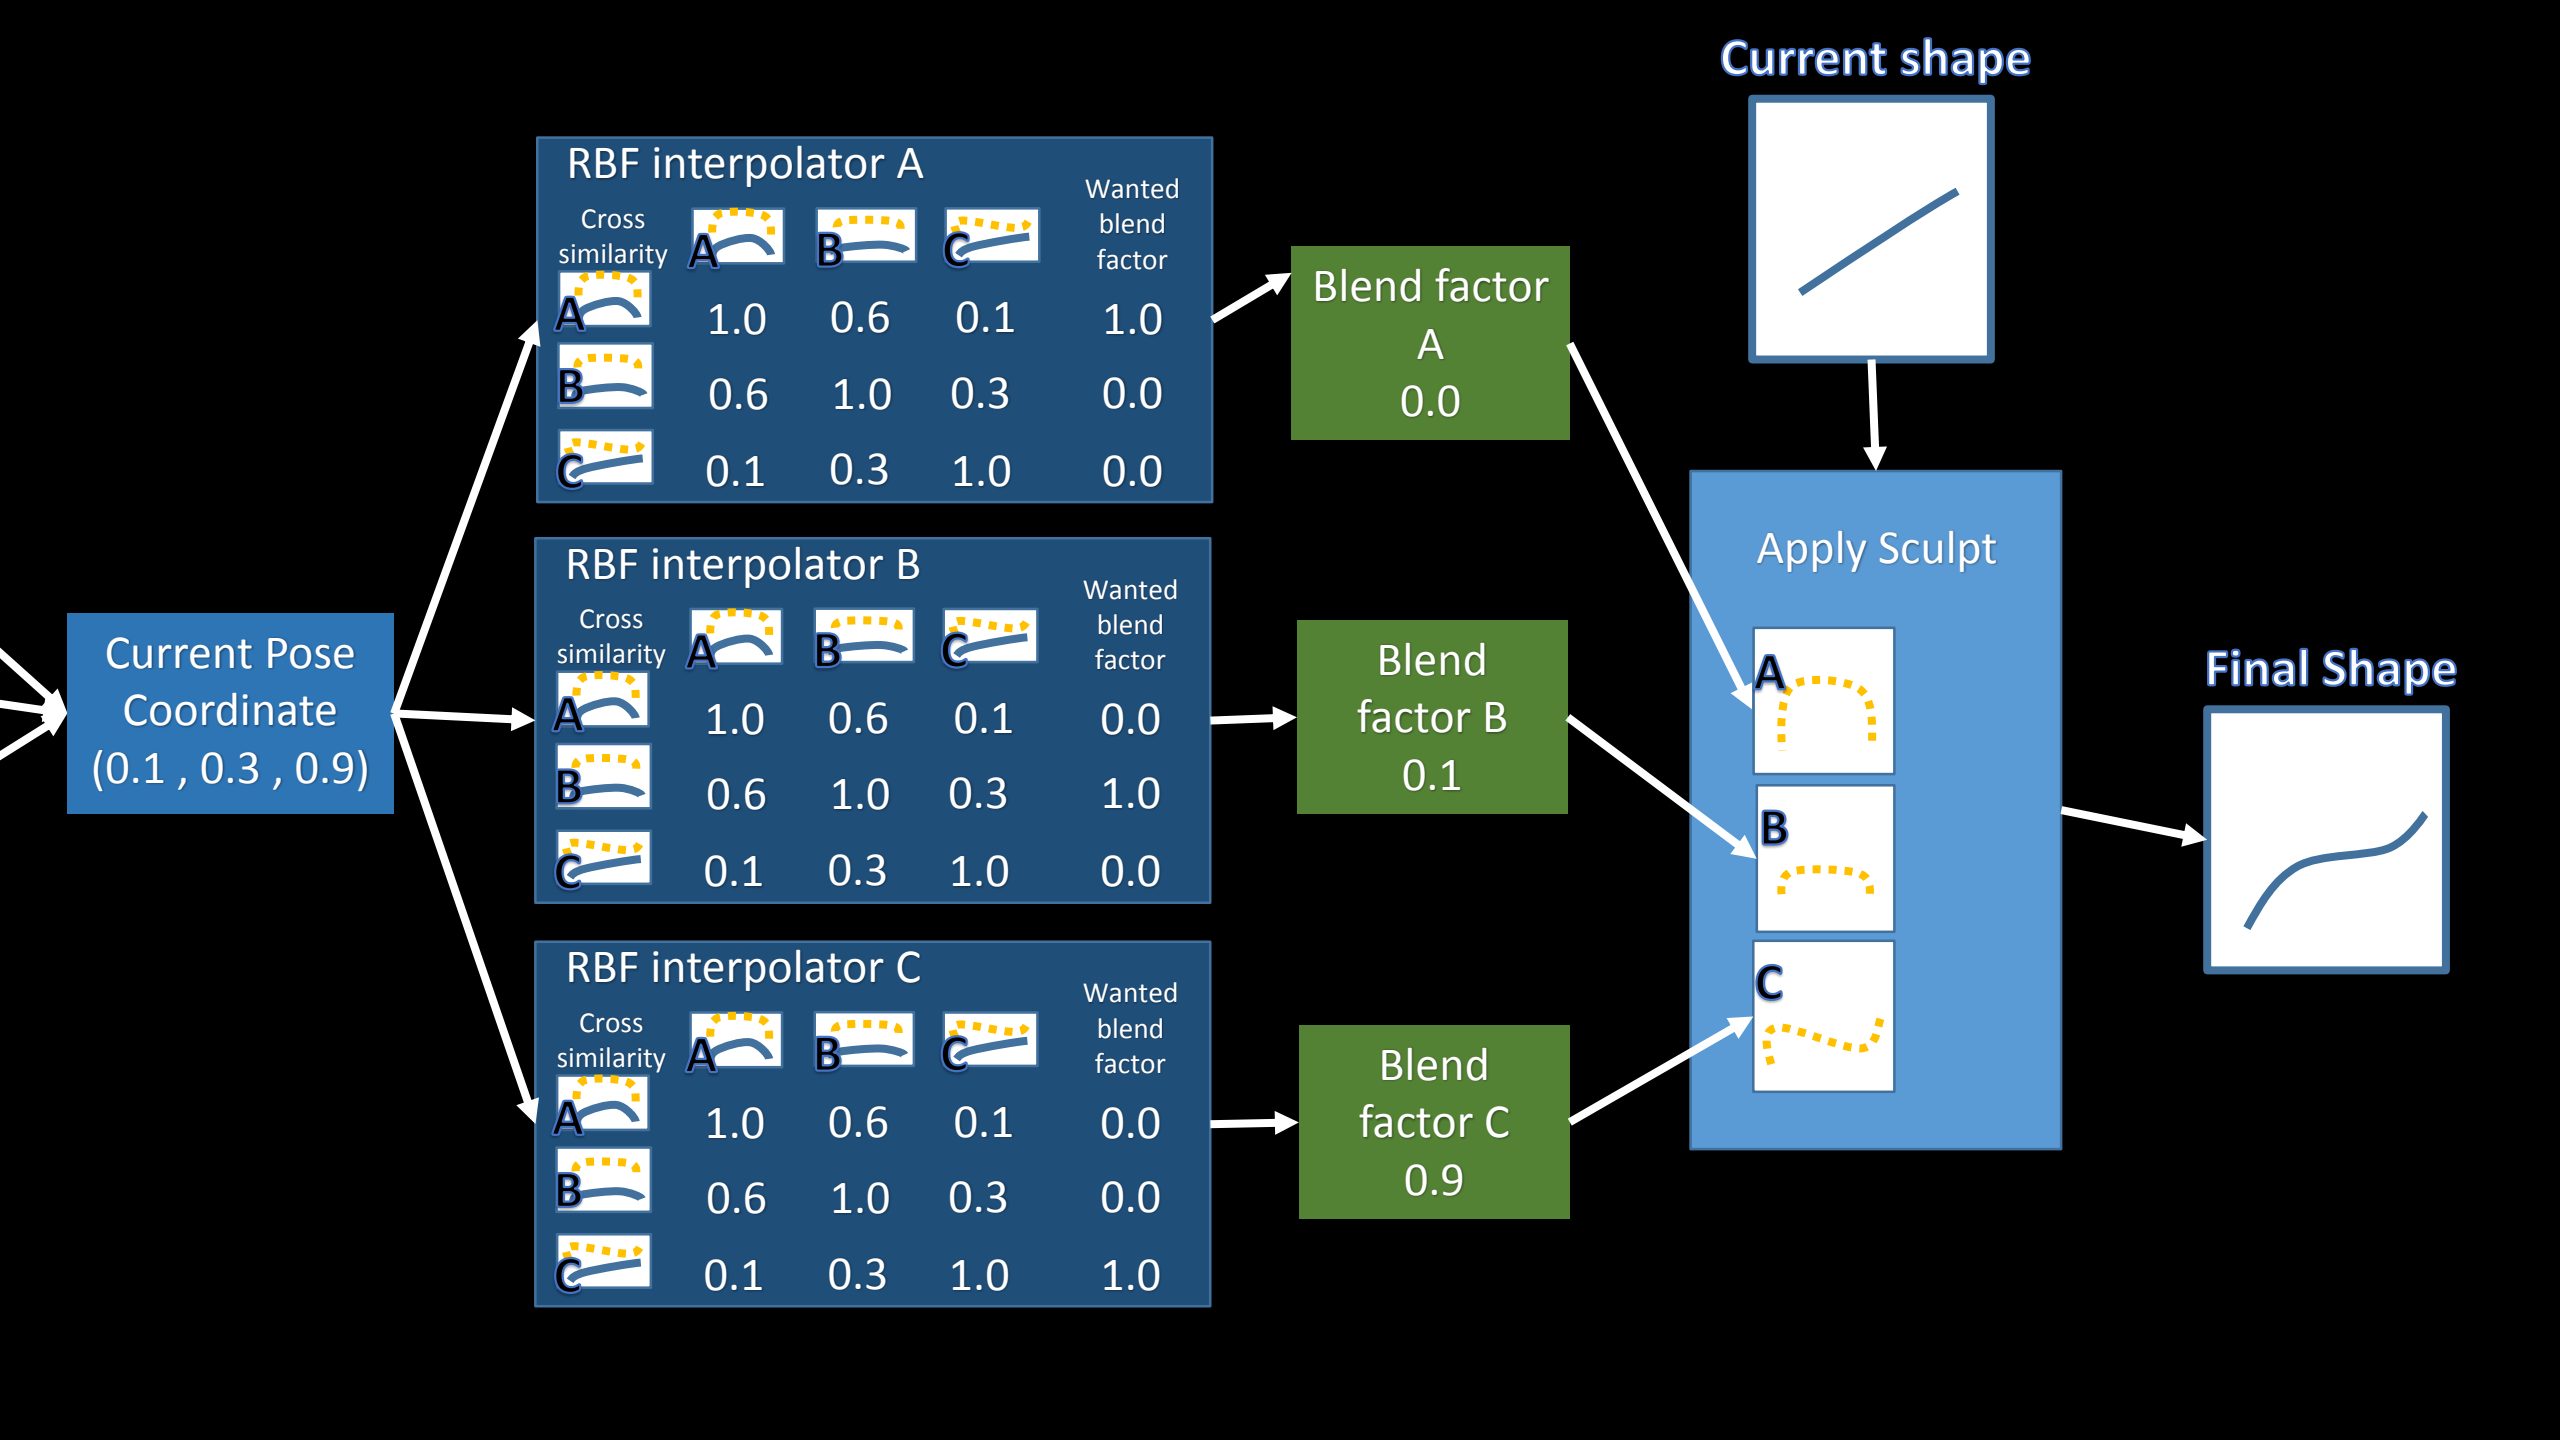

Compute Similarity
0.1

Compute Similarity
0.3

Compute Similarity
0.9

Current Pose Coordinate
(0.1 , 0.3 , 0.9)

Realtime performance

- Use OpenCL on workstation
- Use Intel OpenCL driver on farm
- Working Buffers are mostly stored on GPU
 - Corrections deltas
 - Vertex connectivity
 - Vertex normals
 - tangent matrices, etc...

Shape analysis with GPU

- Two stages parallel reduction algorithm
- Preprocess a reduced set of vertices to analyse
 - Precompute vertices decimation with a 3D grid

Conclusion

- Sculpt wrapping vs blendshapes or corrective blendshapes.
 - Less intermediate sculpting
 - Good visual results and stability
- Shape recognition
 - Fast shape fixes and refinement without any driver
 - Requires minimal user skills
- PSD for facial and body rig correction require more advanced user skills

Many thanks for coming
